Troubleshooting Extension Not Injecting in Comp

Chrome Extension · https://coreel.ai/help/troubleshooting-extension-not-injecting-in-compose-windows/

If the extension doesn’t insert content into a compose window, use this checklist.

Quick Checks

1. Confirm extension is installed, enabled, and pinned.
2. Confirm you are logged into the extension.
3. Confirm at least one active integration exists in /integration.
4. Refresh the compose page and retry.

Supported Context First

Injection depends on supported compose editors and page structure.

If a site/editor has changed DOM behavior, injection can fail until selectors are updated.

Permission Checks

- Ensure extension has required host permissions for the site.
- Reload extension from chrome://extensions.
- Reopen the target compose window after reload.

Session/State Checks

- Log out/in inside extension
- Reconnect provider if integration state is stale
- Retry with a new compose draft instead of an old one

If It Still Fails

- Test in a clean Chrome profile
- Disable conflicting extensions temporarily
- Capture console logs from extension/background/content scripts for diagnosis
